Introduction of hb_report

Shiwen Zhang

Hb_report will collect all logs In the specified time, of course you can specific node you want to collect.

It support heartbeat cluster and corosync cluster

How does hb_report work?

- Find logs should be collected

- Collector return logs to master node?

- The time stuff

- The type of current cluster

- Master connect to collector

- User node

hb_report Parts

Call crm hb_report

Analyze parameter

Get environment

Check node and time

Ssh to collector

Collect logs replace sensitive messages and send back

Analyze logs are collected

hb_report rewrite

- Class master

- Class collector

- Class node

- Utillib module

- corosync_conf_support module

- ha_conf_support module

- Questions I found

- Man manual do not explain -s

- Still get logs from /var/log/message

- Replace sensitive message, analyze configure file as xml way

- When master get crm state logs, in function iscrmrunning.
